# RATION GUARD®

LONGER  
BUNK LIFE

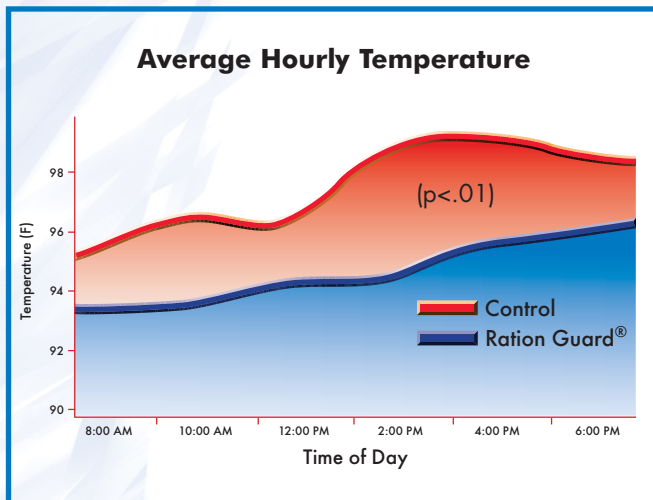

# COOLER RATIONS

**A major problem on commercial farms is hot rations.** This is caused by the presence of yeast and mold. Cattle consuming hot rations may experience a decrease in feed intake that will negatively affect the production of meat and milk.

**RATION GUARD®** contains a patented non-acidic formula that slows down mold growth resulting in cooler rations.

Florida TMR Trial Figure 1

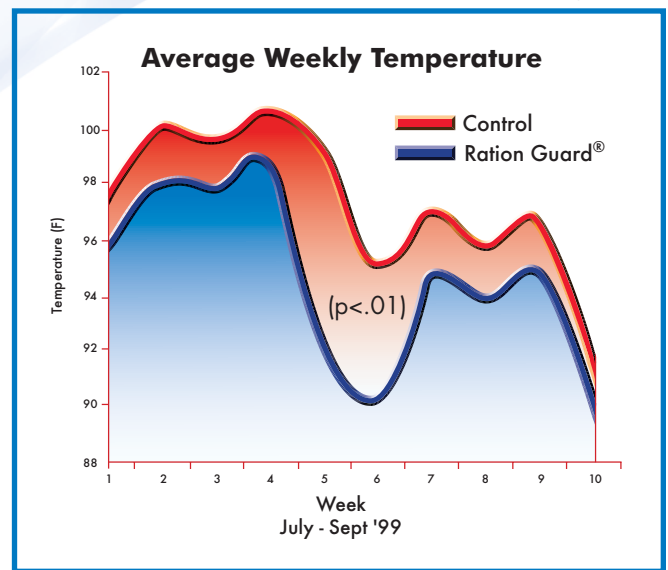

In a recent experiment at a large commercial dairy in Florida (Figure 1), **RATION GUARD®** was tested during the summer months to determine its effect on the **temperature of the total mixed ration (TMR)**.

**RATION GUARD®**-treated feed had consistently lower temperatures indicating less mold growth.

During August (Figure 2), feed treated with **RATION GUARD®** was as much as 6.9 degrees F cooler.

## THE COLD HARD FACTS ARE:

### RATION GUARD®...

- keeps rations cooler
- means longer bunk life
- results in greater retention of nutrients
- maximizes feed intake and production
- is easy to apply
